

logwatch

Summarizes many different logs for common services (e.g., apache, pam_unix, sshd, etc.) in a single report.

- Analyze logs for a range of dates at certain level of detail:

```
logwatch --range {{yesterday|today|all|help}} --detail {{low|medium|others}}'
```

- Restrict report to only include information for a selected service:

```
logwatch --range {{all}} --service {{apache|pam_unix|etc}}
```
