

# bower

A package manager optimized for front-end web development.  
A package can be a GitHub user/repo shorthand, a Git endpoint, a URL or a registered package.

- Install a project's dependencies, listed in its bower.json:

```
bower install
```

- Install one or more packages to the bower\_components directory:

```
bower install {{package}} {{package}}
```

- Uninstall packages locally from the bower\_components directory:

```
bower uninstall {{package}} {{package}}
```

- List local packages and possible updates:

```
bower list
```

- Display help information about a bower command:

```
bower help {{command}}
```

- Create a bower.json file for your package:

```
bower init
```

- Install a specific dependency version, and add it to bower.json:

```
bower install {{local_name}}={{package}}#{{version}} --save
```
