

yum

Package management utility for RHEL, Fedora, and CentOS (for older versions).

- Synchronize list of packages and versions available. This should be run first, before running subsequent yum commands:

```
yum update
```

- Install a new package:

```
yum install {{package}}
```

- Install a new package and assume yes to all questions (also works with update, great for automated updates):

```
yum -y install {{package}}
```

- Find the package that provides a particular command:

```
yum provides {{command}}
```

- Remove a package:

```
yum remove {{package}}
```

- Upgrade installed packages to newest available versions:

```
yum upgrade
```
