

git fetch

Download objects and refs from a remote repository.

- Fetch the latest changes from the default remote upstream repository (if set):

```
git fetch
```

- Fetch new branches from a specific remote upstream repository:

```
git fetch {{remote_name}}
```

- Fetch the latest changes from all remote upstream repositories:

```
git fetch --all
```

- Also fetch tags from the remote upstream repository:

```
git fetch --tags
```

- Delete local references to remote branches that have been deleted upstream:

```
git fetch --prune
```
